The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, replents, of NBP46 can be used to modulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene
                                                                 New polynucleotides encoding Nod factor binding lectins - useful for production of transgenic plants which are able to fix nitrogen.
                                                                                                                                                  Claim 3; Page 42; 57pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a method of modulating mycorrhizal infection by introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNP (lectin/mucleotide promoter operably linked to a heterologous LNP (lectin/mucleotide) in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the polymucleotide), resulting in increased uptake of nutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the bolichos biflorus lectin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants

                                                                                                                                                                                                                                     The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening when need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ATTGGCAATGACCTCGAGTTTACAAAAAGGTCAAACTGAAACCTTAAATTATTCATTAT 974

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a method of modulating mycorrhizal infection by introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNP (lectin/nucleotide promoter operably linked to a heterologous LNP (lectin/nucleotide phosphohydrolase) polynucleotide, or its complement. The LNP's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the colynucleotide), resulting in increase dutake of nutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the Medicago sativa lectin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ģ
                                                                                                                                                                             LNP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modulating mycorhizal infection, useful for improving plant growth, transforming plant cell with a sequence encoding lectin/nucleotide phosphohydrolase.

The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, expression of NBP46 can be used to medulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene

The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             123
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      183

The invention describes a method of modulating mycorrhizal infection by introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNF (lectin/nucleotide phosphotydrolase) polynucleotide, or its complement. The LNF's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the polynucleotide), resulting in increased uptake of mutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This sequence encodes the Lotus japonicus lettin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants. The method is useful for modulating drug resistance of cells. It is useful for increasing the sensitivity of cells to chemotheraputic and antibiotic agents and increasing resistance to herbicides. The present cellular phosphatase). This sequence was used in the present invention to modulate drug resistance. Note: The present sequence is not shown in the specification, but is referred to via its GenBank accession number
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    plant

                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                               셤
The present invention provides the protein and coding sequences of a pea protein with nucleotide triphosphate decomposing activity. The gene can be used for conferring blight resistance on a plant. The present sequence is one version of the coding sequence of the invention
                                                                                                                                                                                                                               137

                                             The present invention provides the protein and coding sequences of a pea protein with nucleotide triphosphate decomposing activity. The gene can be used for conferring blight resistance on a plant. The present sequence is one version of the coding sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                              The present invention provides the protein and coding sequences of a pea protein with nucleotide triphosphate decomposing activity. The gene can be used for conferring blight resistance on a plant. The present sequence is one version of the coding sequence of the invention
